Logic Model Worksheet

Purpose –a logic model shows the relationships between the performers and the ultimate goals their work is intended to achieve. It makes the connection between actions and goals clear for all parties. Below is a typical logic model template, with one high-level example for clarity.

Inputs	Activities	Outputs	Outcomes (short and long term)	Impact
<i>The resources available to support the performance or program (people, funding, time, materials, etc.)</i>	<i>The sequenced actions that performers or programs take with the available resources to achieve the stated goals (offerings, events, products, services, etc.)</i>	<i>Direct, tangible accomplishments of the activities with the intended audiences</i>	<i>The measurable changes in audience behavior or capability that result from the performance or program</i>	<i>Realized changes in the populations, organizations, or systems the performance or program was designed to influence (typically these are community health goals)</i>

Tips:

- Many people find it easiest to begin with the *Activities*, then describe the *Outputs*, *Outcomes* and *Impact* before returning to identify the *Inputs* required
- Some logic models combine components—especially *Activities* and *Outputs*; for a logic model that will guide a needs analysis we want to be as explicit as possible in describing the individual actions of performers with their *Outputs* and *Outcomes* since it is the performance behavior of individuals we are most interested in investigating
- Keep your logic model entries at a fairly general level to begin with. You don't have to describe *Activities* at the granular level (example: CHW asks patient to lie on examination table), unless or until a specific *Activity* is associated with a performance gap. Then it might be illustrative to consider the sequences of actions that make up *Activities* to further clarify what is causing or contributing to the gap. You might also revise the Logic Model to reflect changes undertaken to address gaps going forward.
